FLINT is a homologue of tumour necrosis factor receptor proteins. FLINT inhibits the binding of FAS to FAS ligand. The mature Protein protein is modified to produce analogues, which have greater potency, longer in vivo half-lives, decreased aggregation, decreased absorption onto surfaces, increased solubility and improved ease of formulation. The FLINT analogue is useful for treating a patient suffering from disease or condition relating to abnormal apoptosis such as acute lung injury, acute respiratory distress syndrome, pulmonary fibrosis, chronic obstructive pulmonary disease, ulcerative colitis, or

The present sequence is that of cDNA coding for human FAS ligand inhibitory protein FLINT mature protein (see AAB19705). FLINT is a tumour necrosis factor receptor homologue that binds FAS ligand, preventing its interaction with FAS. This interaction is implicated in runaway apoptosis and inflammatory disease. FLINT also binds to LIGHT, a membrane-bound ligand, which may play a role in immune modulation and apoptosis. The invention relates to novel FLINT
                                                                                                                       Novel protease resistant FAS ligand inhibitory protein resistant to in vivo or in vitro proteolysis at amino a of the mature protein, useful for treating autoimmune of

                                                                                                                                                                                                                                                                                                                                                          9
analogues (see also AAB19706-09) that are resistant to proteolysis by trypsin-like proteases between positions 218 and 219 of the FLINT mature protein sequence.

Mucleic acids, vectors and transformed host cells for recombinant production of the analogues are claimed. FLINT cDNA is used as a template for introducing the required point mutations e.g. via PCR mutagenesis. The protease resistant FLINT analogues are used to prevent or treat acute lung injury, acute respiratory stress syndrome, ulcerative colitis, chronic obstructive pulmonary disease, pulmonary fibrosis, to inhibit T lymphocyte activation, and to facilitate organ preservation for transplantation (claimed).
                                                                                                                                                                                                                                                                                                                                               GTGGCAGAAACACCCCACCTTGCGGGGACGCAGAGACAGGGGAGCGGGTGTGC

Human FLINT (also known as osteoprotegrin 3) is a new tumour necrosis factor receptor (TNFR) superfamily member, which binds FasL and LIGHT and prevents FasL-Fas mediated apoptotic and pro-inflammatory activity. WFLINT inhibits FasL-Fas mediated apoptotic and pro-inflammatory activity. WFLINT is useful for treating acute respiratory distress syndrome, treating or inhibiting ulcerative collist, inhibiting ischemic injury during organ transplantation or for organ preservation during transplantation. WFLINT abnormal (Mepatocyte) apoptosis, seppls, disorders associated with inflammation, hepatitis, ischemia, hypercoagulation or reperfusion, damage to a cardiac myocyte resulting from abnormal myocardial ischaemia, hyper indiabetes, cancer, damage to an innocent pystrander tissue induced by a chemotherapeutic or therapeutic irradiation, aplastic anaemias, myelodysplastic syndromes and pancytopenic conditions.

Example 1; Page 53; 60pp; English

The present sequence is human mature fas ligand inhibitory protein (FINIT) cDNA, FLINT, a homologue of tumour necrosis factor receptor protein (TNPR), binds fas ligand (FasL) and thereby preventing the contraction of FasL with fas. FLINT comprising O-linked or N-linked colligosaccharides is useful for preventing or treating acute lung injury (ALI), acute respiratory distress syndrome (ARDS), ulcerative colitis, correctly pulmonary disease (COPD) and pulmonary fibrosis (PF), correctly contracted pulmonary disease (COPD) and pulmonary fibrosis (PF), correctly contracted pulmonary disease (COPD) and pulmonary fibrosis (PF), correctly contracted pulmonary fibrosis (PF), correctly contracted preservation for transplantation and to inhibit T (Inguise) as rheumatoid arthritis, fibroproliferative lung disease, correctly, inchaemia, brain trauma/injury, chronic renal failure, graft-vs-host disease, cutaneous inflammation, vascular leak syndrome, helicobacter pylori infection, goitre, atherosclerosis, insulin dependent C diabetes mellitus (IDDM), osteoporosis, inflammatory bowel disease such as C Crohn's disease, sepsis, pancreatitis, cancer, autoimmune disease such as C peoriasis, Down's syndrome, and multiple sclerosis.

```
The invention relates to a new method of administering FLINT administration of a therapeutic amount of the FLINT or FLINT analog. The method enables systemic absorption of FLINT through lungs and significantly reduces or eliminates the need for administering FLINT by injection or other routes of administration. The method is useful in treating disorders related to enhanced apoptosis (e.g. organ failure in liver, kidneys and pancreas) and inflammatory diseases associated with neutrophil activation (e.g. sepsis, acute respiratory distress syndrome, acute lung injury, systemic inflammatory response syndrome (SIRS) and multiple organ dysfunction (MODS). The method minimises the pain and discomfort of injection methods. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                               Administering FLINT (FAS ligand inhibitory protein) or FLINT analog, useful for treating e.g. sepsis or respiratory distress syndrome, involves pulmonary administration of a therapeutic amount of the FLINT or FLINT analog -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TyrCysAsnValLeuCysGlyGluArgGluGluGluAlaArgAlaCysHisAlaThrHis

The present invention describes therapeutic applications of mature FLINT (C (mFLINT)) for use in the treatment of acute liver failure. Mature FLINT (C (mFLINT)), which is a member of the tumour necrosis factor receptor superfamily, is used for treating acute liver failure, inflammation of the liver, abnormal special sequences, a disorder associated with inflammation, hepatitis, abnormal apoptosis, an ischaemia-associated injury or disorder such as hypercoagulation (including use with thrombolytic or anti-thrombolytic agents), reperfusion-associated injury or disorder, Type I diabetes, cancer, cell damage or damage to an consider tissue that is induced by a chemotherapeutic agent or therapeutic irradiation, treating haematopoietic progenitor cells that the constant bystander tissue that is induced by a chemotherapeutic agent or therapeutic radiation or chemotherapy, aplastic anaemia, myelodysplastic syndrome or a pancytopenic condition. mFLINT is also used for promoting the growth or differentiation of a haematopoietic progenitor cell or CD34+ cell and preventing damage to a cardiac myocyte resulting from abnormal myocardial ischaemia. The present sequence is the coding sequence of the human Fas ligand inhibitor (FLINT). The FLINT protein is involved in cell-specific approass, and can be used to treat inflammatory and autoimmune diseases cuch as rheumatoid arthritis, inflammatory bowel disease, disease, fifections diseases disease, diabetes, psoriasis and Graves' disease, confections diseases such as HIV-induced lymphopenia, fulnimant viral hepatitis B/C, chronic hepatitis and cirrhosis, and H. pylori-associated ulceration, ischaemia and reperfusion conditions including acute and atherosclerosis, and Alzheimer's and Parkinson's diseases, acute lung injury and acute respiratory distress syndrome, congestive heart failure and atherosclerosis, and Alzheimer's and Parkinson's diseases, brain injury and acute respiratory distress syndrome, Crohn's disease, brain anaemia, myelodysplasia, ulcerative collitis, Down's syndrome, and multiple sclerosis. In addition, the gene and protein can be used to prevent apoptosis following organ transplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This DNA encodes a HUMAN NTR-1 polypeptide, a novel orphan receptor. The protein is related to osteoprotegerin (OPG) and to tumour necrosis factor receptor (TNRR). Host cells transformed with a vector comprising the HUMAN NTR-1 nucleic acid are used for the recombinant expression of the protein. HUMAN NTR-1 proteins and antibodies immuno specific for the protein are useful for diagnosis and treatment of humans and animals, especially muscle disorders, as the receptor is involved in regulation of bone mass and muscle metabolism. HUMAN NTR-1 receptors are also useful for screening for novel binding agents, and cognate ligands, which may be used to treat disorders associated with HUMAN NTR-1 imbalance.
                                                                                                                                                                                                                                                                                                           HUMAN NTR-1; orphan receptor; osteoprotegerin; OPG; TNFR; human; tumour necrosis factor receptor; muscle disorder; bone mass; screening; muscle metabolism; binding agent; cognate ligand; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human tumour necrosis factor receptor (TNFR)-falpha and 6beta protein and their corresponding nucleic acids. The invention provides screening methods for identifying agonists and antagonists of TNFR-falpha and 6beta activity. The invention also provides diagnostic and therapeutic methods for detecting and treating immune system-related disorders. The method is useful for treating or preventing an inflammatory disease or disorder selected from bowel disease, encephalitis, atherosclerosis and psoriasis, an autoimmune disease or disorder selected from systemic lupus crythematosus, arthritis, rheumatoid arthritis, multiple sclerosis, Crohn's disease, and autoimmune encephalitis, graft versus host disease (GVHD), and an allergy or asthma. The present sequence is Mammalian synthetic TNFR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecules comprising a polynucleotide encoding huma tumor necrosis factor receptor (TNFR)-6alpha and 6beta polypeptides useful for treating disease e.g. inflammatory and autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 903

The present sequence encodes the tumour necrosis factor (TNF) receptor polypeptide NTR3. The NTR3 polynucleotides and polypeptides are useful for treating diseases such as acquired-immunodeficiency syndrome (AIDS) anaemia, autoimmune diseases, cachexia, cancer, cerebral malaria,
                                                                                                rejection

sick syndrome, hademorrhagic shock, hepatitis, insulin resistance, beloves, leukaemia, meningitis, multiple sclerosis, myocardial ischaemia, obesity, rejection of transplanted organs, rheumatoid arthritis, septic shock syndrome, stroke, adult respiratory distress syndrome (ARDS), tuberculosis, and a number of viral diseases. The NYR3 polypeptide is beful for identifying or developing new (ant) agonists of NYR3. It may be used as an immunogen to which antibodies may be raised. NYR3 nucleic acid molecules may be useful as hybridisation probes in diagnostic assays to test, either qualitatively or quantitatively, for the presence of an NYR3 DNA or corresponding RNA in mammalian tissue or bodily fluid samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          140

The MGB protein is a member of a family of proteins which have roles in immune responses, cell death, cell proliferation and stimulation of cell differentiation. MGB lacks a transmembrane domain stimulation of cell differentiation. MGB lacks a transmembrane domain can is a secreted factor suggesting that it functions as a natural multitude of tissues suggests that MGB may play a role in cancer by inhibitor for its ligand. The altered expression pattern of MGB in a multitude of tissues suggests that MGB may play a role in cancer by such a ligand. This anti-apoptopic role of MGB suggests that modulators of MGB will be useful in treatment of apoptosis. The diseases such as various forms of cancer and various bone disorders. MGB nucleic acids and proteins are therefore useful for treating conditions involving atypical apoptosis and for identifying cancer and other diseases associated with abnormal levels of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        á
                                                                                                         The present sequence represents the human tumour necrosis factor creceptor-6 alpha (TNFR-6 alpha) cDNA. The invention also provides for the TNFR-6 beta cDNA (ANY9086). TNFR-6 alpha and TNFR-6 beta are members of the tumour necrosis factor receptor (TNFR) family. TNFRs care expressed in endochelial cells, keratinocytes, normal prostate and prostate tumour tissue. For a number of disorders of these cells, carticularly of the immune system, substantially altered (whether increased or decreased) levels of TNFR-6 alpha and/or TNFR-6 beta gene expression can be detected, therefore the TNFR-6 alpha and TNFR-6 beta polypeptides, nucleic acids and antibodies are claimed to be useful in the diagnosis of such disorders. Mutations of the TNFR-6 alpha and TNFR-6 beta genes can also be detected. The TNFR polypeptides are claimed to be useful for identifying ligands which may be useful in the treatment of apoptosis related disorders.
                                                                                                                                                                                                                                                                                                                                                      WPI;

ints sequence encouses the invention. The TNFR-falpha and TNFR-fabet DNA and protein sequences can be used in the prevention, treatment and diagnosis of diseases associated with inappropriate TNFR expression. The nucleic acids, polypeptides, antibodies, agonists and antagonists against them may be used for the treatment of a range of conditions such as diseased with neovascularisation (sepecially coular neovascularisation) (sepecially coular concert, breast cancer and colon cancer), diabetic retinopathy conditions ascolated opthalmopathy tissue/cell damage, wounds, microbial and parasitic infections, bone disease (e.g. osteoporosis), atheroscierosis, pain, cardiovascular disease (e.g. osteoporosis), allorders (e.g. disorders (e.g. Albeimer's disease), immune disobetes, asthma, psoriasis, septic shock and ulcerative
                   bone disease; osteoporosis; atherosclerosis; cardiovascular disease; heurodegenerative disorder; Alzheimer's disease; immune disorder; graft rejection; rheumatism; liver disease; autoimmune diabetes; asthma; psoriasis; septic shock; ulcerative colitis; therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           associated opthalmopathy; cell damage; parasitic infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (TNFR)

Detected at very low levels in brain, placenta and skeletal muscle. Highly expressed in fetal kidney, liver and lung. INDUCTION: Upregulated by increasing calcium-concentration in the medium and estrogens. Downregulated by glucocorticoids. PTM: N-glycosylated. Contains sialic acid residues. SIMILARITY: CONTAINS 4 TMFR-CYS REPEATS.
SIMILARITY: CONTAINS 2 DEATH DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUNCTION: Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBCELLULAR LOCATION: Secreted

BY SIMILARITY.
                                                                                                its function. Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRALL and protect against apoptosis. TRALL binding blocks the inhibition of osteoclastogenesis (By similarity).
-: SUBCELMILAR LOCATION: Secreted (By similarity).
-: INDUCTION: Upregulated by osteopontin.
-: SIMILARITY: CONTAINS 2 DEATH DOMAINS.

"Osteoprofegerin reverses osteoporosis by inhibiting endosteal osteoclasts and prevents vascular calcification by blocking a process resembling osteoclastogenesis.";
J. Exp. Med. 192:463-474(2000).
-!- FUNCTION: Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial adloification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A.

-!- FUNCTION: Receptor with high affinity for TNFSF2/TNF-alpha approximately 5-fold lower affinity for homotrimeric TNFSF1/Lymphotoxin-alpha (By $1milarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

- SUBCILIVIAR LOCATION: Type I membrane protein (Probable).
- SUBCILIVIAR LOCATION: Type I membrane protein (Probable).
- TISSUE SPECIFICITY: Highly expressed in heart, brain, placenta, pancreas, lymph node, thymus and prostate. Detected at lower levels in lung, skeletal muscle, kidney, testis, uterus, small intestine, colon, spleen, bone marrow and fetal liver. Very low levels were found in adult liver and peripheral blood leukocytes.
- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
- SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 15-JUN-2002 (Rel. 41, Created)
